

Vignesh Agencies Service App

What it is

Flutter app for Vignesh Agencies that combines customer service, warranty tracking, and product sales in one place. It provides separate user and admin experiences and connects to Firebase services for backend data and notifications.

Who it's for

Primary users are Vignesh Agencies customers who own appliances and need service, warranty validation, or purchases; admins and staff manage requests, products, and operations.

What it does

- User and admin login flows, including phone OTP verification.
- Product catalog browsing, product details, cart, and checkout screens.
- Register appliances and submit service requests with request detail views.
- Admin dashboards for service requests, warranty validation, and orders.
- Marketing banners and promo notifications with FCM topic trigger support.
- Referrals, agents management, and help/support contact screens.

How it works

- Flutter UI in lib/screens with routing handled by GoRouter and separate user/admin shell layouts.
- Provider injects services (Auth, Firestore, Storage, Cart, Orders, Push, Warranty notifications) at app start.
- Data models map to Firestore collections; Firebase Auth/Firestore/Storage/Messaging back the app; a Cloud Function sends promo notifications to an FCM topic.

How to run

- Not found in repo: no explicit run commands or environment setup steps are documented in README.md.
- Not found in repo: no Firebase project setup steps or emulator/hosting instructions are documented.
